POLKU

Every cancer pathway, on the clock.

A phone line for suspected lung cancer. Polku does the handoffs between care steps.

JUNCTION 2026 / ASTRAZENECA / EQUAL CARE ACROSS FINLAND

ESPOO 13-15.11.2026

Matti is 71.
He has been coughing for seven weeks.

49

days, and no one has called him

Illustrative patient. SYNTHETIC.

Found late. And nobody counts the wait.

65–70 %

of lung cancers in Finland are found at an advanced stage.

0

public county series of lung cancer pathway times that we could find. Sweden and Denmark publish theirs per region.

REAL. Source: Filha lung cancer programme 2026–2035 (Knuuttila 2021). Pathway times: our search, no public county series found.

POLKU

Care doesn't stall inside the steps.
It stalls between them.

2 days
nurse callback

1 week
to CT

2-3 weeks
to the first specialist visit

Sources: pirha.fi · hyvaks.fi. The 2-day callback is a Polku proposal.

POLKU

The AI listens.
The rules decide. The nurse confirms.

Patient calls the line.

Speech becomes typed symptoms.

Rules match a published criterion.

Nurse accepts a proposed time.

Agent calls back and books it.

The record moves to the next step.

Red flags always mean 112. Nothing before identification. Every access is logged.

Criteria: Swedish standardised lung cancer pathway v1.4

Three partners. Three jobs.

ElevenLabs

The phone line. It answers the call, and calls the patient back to book the time.

Verda

Sovereign AI. Qwen3 runs on Verda GPUs in Europe, on infrastructure we control. It turns speech into typed symptoms.

Aiven

Postgres with the ontology: the patient record, the clocks and the access log.

Polku as built: github.com/3nd3r1/polku

Pathways by 2028, says the strategy. We built one this weekend.

Lung is one typed, cited file. The next cancer is the next file.

polku.ender.fi
